

Abstract

For symmetric considerations, there are several factors to watch out. Such as pocket tension, implant shape, nipple position, cleavage groove line.

Pocket tension: thoracic base area, skin, muscle, fascia, and blood retention.

Implant selection: the front view is the same implant width lateral view depend on the projection of implant and thoracic cage

Nipple position:

- adjust PM release line,

- adjust implant size

- groove line: controlled dissection by endoscopic view or IMF incision
